Previous Press Release on Foreign Trade appeared on March 12, 2009

Israel's Foreign Trade – March 2009

To all readers!!

Beginning January 2009 some of consumption and investment goods classifications were changed. The change should be noticed especially on import of vehicles series and the percentage attributed to consumption and investment groups. All the relevant series were changed up to January 1995.

In March 2009, **import of goods** totaled \$3.8 billion, **export of goods** totaled \$3.4 billion and the **trade deficit** totaled \$0.4 billion.

The above is based on **temporary data** regarding goods that cleared Customs, not including trade between Israel and the Palestinian Authority. Final data for 2008 are published in this press release. In addition, the data do not include import and export of services that include, among others, software. Data on all exports and imports of goods and services are published as part of the Balance of Payments, every quarter.

Development of trade in goods in March 2009, compared with January, was influenced by changes in the value of the U.S.A. Dollar against other currencies in which **import and export** transactions are conducted. Compared to the Euro the U.S.A. Dollar fell by 2.4%, compared to the UK Pound rose by 1.2%, compared to the Swiss Franc fell by 1.0% and compared to the Japanese Yen the U.S.A. Dollar rose by 5.6%.

Written by Helen Brusilovsky

For explanations and clarifications regarding the contents of this Press Release,
Please contact the Press Relations Unit, at 02-6527845, 050-623 5124

The trend data calculated by the Central Bureau of Statistics, seasonally adjusted and adjusted for irregular elements, point to a drop of **export of goods** (excluding diamonds) of 33.4% and **imports of goods** point to a drop of 35.3%, at an annual rate, during January-March 2009.

BREAKDOWN OF THE FINDINGS:

Export of Goods

In March 2009, manufacturing exports (excluding diamonds) constituted 83% of all export of goods. Export of diamonds constituted 14%, and the remaining 3% was agricultural exports.

* The last 3 points are subject to substantial revisions

Distribution of **manufacturing exports by technological intensity** (excluding diamonds), indicates that **high technology industries** constituted 51% of it in March 2009 (\$1.5B.). Trend data of **exports by high technology industries** points to a drop of 10.8%, at an annual rate.

— Trend data — Seasonally adjusted data The last 3 points are subject to substantial revisions

Exports by medium-high technology industries (27% of total manufacture exports) in March 2009 totaled \$0.8B. Trend data of **exports by medium-high technology industries** point to a drop of 49.2%, at an annual rate, in January-March 2009.

Exports by medium-low technology industries (15% of all manufacture exports) in March 2009 totaled \$0.4 B. Trend data of **exports by medium-low technology industries** point to a drop of 63.4%, at an annual rate, in the last three months.

Exports by low technology industries (7% of all manufacture exports) in March 2009 totaled \$0.2 B. Trend data of exports by low technology industries point to a drop of 18.2%, at an annual rate, in January-March 2009.

Export of diamonds (polished and rough) in January-March 2009 totaled 1.3B lower by 61.0% than January-March 2008.

Agricultural exports in January-March 2009 totaled \$382M (temporary data) – lower by 21.6% than January-March 2008.

Import of Goods

Import of goods, in current prices in U.S. dollars, totaled – as mentioned - \$3.8B.

A breakdown of the data of **import by use** indicates that in March 2009, 41% of total imports were **import of raw materials** (excluding diamonds and fuels); 18% was **consumer goods**, 16% was **machinery, equipment and land vehicles for investment**; and the rest **diamonds, fuels and ships and aircraft**.

* The last 3 points are subject to substantial revisions

Import of raw materials (excluding diamonds and fuels) in March 2009 totaled \$1.5B. A breakdown of trend data reveals that in January-March 2009, **import of raw materials** point to a drop of 46.4% by annual rate. A breakdown by groups of **import of raw materials** in the last three months, points to a drop of 71.3% in the **import of non-ferrous metals**.

Import of consumer goods in March 2009 totaled \$0.7B. A breakdown of trend data indicates that in the last three months, **import of consumer goods** dropped by an annual rate of 10.4%. **Import of durable goods** dropped by of 11.3% an annual rate. Most of the drop was recorded in **import of furniture and electrical equipment** (-20.3%). **Import of non-durable goods** dropped, by an annual rate of 15.4% during the last three months.

Import of investment goods (excluding ships and aircraft) in March 2009 totaled \$0.6B. A breakdown of trend data indicates that in January-March 2009, **import of investment goods** dropped by an annual rate of 26.4%. A breakdown by groups points that **import of machinery and equipment** point to a drop of 26.6% in the last three months.

Import of diamonds (rough and polished) in January-March 2009 totaled \$0.7B, a drop of 70.8% compared to the same months in 2008.

Import of fuels (crude oil, distillates and coal) in January-March 2009 totaled \$1.7B. During the same months in 2008 the import of fuels totaled \$3.2B.

Next Press Release on Israel's Foreign Trade will appear on May 13, 2009.

DEFINITIONS AND EXPLANATIONS

The Population Investigated

1. Imports and exports are recorded according to the "Special System"¹, by which only that portion of the trade flowing through customs is included. Accordingly, imports do not include goods imported and stored in bonded warehouses, and exports do not include goods exported from these warehouses. Neither included are goods in transit.
 - a. **Gross imports** include consignments imported from abroad for local use (including finishing and repair) which are freed by the Customs immediately after unloading, or which were freed after a time from the bonded warehouses of the Customs. Import data do not include commodities put into bonded warehouses, except for a number of productive enterprises, which are recognized as bonded warehouses. Imports do not include consignments which were exported in the past and which were returned to Israel without any further processing.
 - b. **Net imports** are obtained by deducting from gross imports the value of goods imported earlier and returned to a supplier abroad without processing or changing its form. As there is no way of identifying the date of entry of the goods to Israel which are being returned abroad, the deduction is done on the date of return abroad. For this reason the returns are deducted from the grand total and not from items detailed by branches.
 - c. **Gross exports** include the flow of products abroad, except consignments of commodities which were previously imported and then returned to a supplier abroad without any processing. It also includes part-finished goods which are sent abroad for additional processing and which eventually will be returned to the sender, and goods which were imported and sold to abroad without processing, when the purchaser is not the supplier.
 - d. **Net exports** are obtained by deducting from the value of gross exports the value of goods, which were previously exported but were returned to the Israeli supplier without processing or change of form. As there is no means of identifying the original date of consignment abroad of exports returned from abroad, the deduction operates on the date of return rather than the date of original export. For this reason returns are deducted from the grand total and not from items detailed by branches (excluding diamonds).
2. The date of statistical registration of the import is the date of the release of the goods by the Customs authorities, whereas for exports it is the date of loading the goods on ship, airplane, or trucks (land transport to Jordan).
3. Foreign trade statistics include, among others, the following goods and business activities:
 - a. Personal import and export: personal effects of immigrants, seamen, returning residents and foreign diplomats (import) and of emigrants (export).
 - b. Parcels dispatched by mail (in recompense or as gifts).
 - c. Ships and aircraft are included in import and export data whether they have passed through Customs or not. Imports include ships purchased from abroad by Israeli companies and sailing under Israeli flag or a foreign flag. It should be noted that ships and aircraft do not undergo the procedure of passing through Customs.

Exports include ships and aircraft, which were produced in Israel and those, which were previously purchased and later resold abroad in the reporting period.
 - d. Products for exhibitions and fairs are, in principle, included in foreign trade data only if they were sold or given away free of charge. Returns from exhibitions are not included in foreign trade but there are difficulties in identifying these flows.
 - e. Equipment imported or exported on a lease basis (e.g., electronic computers and other data processing equipment).
 - f. Gold and silver (non-monetary), both in processed or partly processed form, scrap and remnants intended for industry, smelting or medical use.

¹ United Nations, *International Trade Statistics Concepts and Definitions*, Statistical Papers, Series M, No. 52/ Rev. 2, 1998.

- g. Fuel and food supplied to foreign ships and aircraft in Israeli ports are included in export since 1969, even though they did not pass through Customs.

4. Special transactions and commodities not included in foreign trade statistics:

- a. Commodities imported or exported for a limited period of time and returned without having undergone any processing, e.g. personal effects of tourists (including cars); goods intended for exhibitions, fairs, displays, etc.; commodities intended for temporary storage only; equipment sent to perform contract work and returned after use.
- b. Effects purchased by tourists in Israel or by Israelis abroad. An estimate of the value of these purchases is included in the account of services in the Balance of Payments. In cases where duty has been charged on goods purchased by Israeli tourists, the goods were included in total imports.
- c. Engines and parts of aircraft sent by local airlines to their branches or representatives abroad for replacement or repairs and those sent to Israel from branches abroad for repairs or replacement.
- d. Fish caught by Israeli fishing vessels.
- e. Monetary gold, securities and legal tender (notes and coins) or currency about to be made legal tender (local currency notes printed abroad are recorded according to the value of the printers and not according to face value).
- f. Fuel and food supplied to Israeli ships and aircraft in foreign ports (recorded in Balance of Payments as services).
- g. Ballast and dunnage supplied to foreign ships in Israeli ports and to Israeli ships in foreign ports.
- h. Imported military equipment and weapons (estimated value is included in the commodities account in the Balance of Payments). The flow is not included in the import of goods because it does not undergo the usual procedure of passing through customs.

5. The trade with the Palestinian Authority

The trade data do not include the transactions with residents of the Palestinian Authority. The data also do not include the value of the import and export commodities, which were released by the Israeli customs and belong to residents of the Palestinian Authority. Data on trade with Palestinian Authority is published within the Balance of Payment.

Classification of Commodities

1. The classification, according to which foreign trade statistics are processed and published, is the classification that serves the customs² in handling the import and export shipments. Import data are classified according to the details in the customs tariff³ and export data - according to the "Classification of Export Commodities"⁴.

As of January 1st 1988, the customs' classification of commodities, which serves the customs and statistical data processing, was based on a new international nomenclature, which was prepared by the Customs Cooperation Council – "The Harmonized Commodity and Coding System" (H.S.)⁵. This nomenclature replaces the Nomenclature "Classification of Goods in Customs Tariff" of which the first version was introduced at 1962 named "Brussels' Tariff Nomenclature" (B.T.N.) and the last version was the C.C.C.N. – "Customs Cooperation Council Nomenclature". In the special Supplement to Quarterly No. 4, 1988, details are presented on the new nomenclature, its aims, structure, and its principles of classification.

⁴ The Ministry of Industry and Trade, The Customs Authority *Classification of Export Commodities Edited* according to H.S.- 1988, *Customs and Excise Dept.*, No. 511, 1 January 1988, updated for 1992.

⁵ http://europa.eu.int/comm/eurostat/ramon/nomenclatures/index.cfm?TargetUrl=LST_NOM

2. **S.I.T.C.**⁶

Import and export data are also classified according to the U.N.⁷ Standard International Trade Classification, in which goods are classified in groups that are better suited for statistical presentation. This classification is obtained by a special sorting of details in the customs classification and their concentration in groups according to the structure of the classification. More details on the S.I.T.C. and its last version are presented in the Supplement to the Foreign Trade Quarterly No. 1, 1988.

3. **Classification by Economic Branches**

Export data is presented by branch of origin, meaning: the classification was done by the economic branch to which the product pertains by character. The division of the products into branches was done based on the description of the goods in the goods classification and not based on the exporter's branch. The definition of the branches is based on the classification of economic branches prepared by the Central Bureau of Statistics.

Starting with Quarterly No.1, 1995, data are published on export goods classified by new branch (origin)⁸. Until this Quarterly export goods were classified according to the "Standard Industrial Classification of All Economic Branches 1970" (Technical Publication No. 46).

Starting with Monthly No.8, 2003, data on export goods are published classified by new branch (origin)⁹.

Export data classified by new branch can be obtained from the Bureau's database starting 1988.

4. **Classification by Economic destination.**

This classification, according to which data on imports are presented, divides the items by three uses: consumer goods, raw materials for production and investment goods. Each use is sub-divided into secondary groups. In certain cases when a product is intended for more than one use, this product's import value is divided into the appropriate uses (e.g. passenger cars are both consumer goods and investment goods; sugar functions as consumer goods as well as a raw material).

In this classification the division of imports is into primary uses of the goods, i.e. the first use made of them: consumption, as raw materials - for production, or investment. Unprocessed and partly processed goods and components for assembling machinery and automobiles are classified as "raw materials". Spare parts, tools and accessories for additional use are also included under "raw materials". The classification by economic use is based on "Survey of Import Destination" which is conducted once in several years by the Central Bureau of Statistics.

The Classification of Import Commodities, by economic destination was updated in the No.3, 1993 Quarterly, as based on the Import Destinations Survey 1988. The results of that survey were published in Special Publication No. 952¹⁰. Until the said quarterly, commodities were classified according to the 1982/83 survey, and henceforward they are classified according to the 1988 survey. The results of that survey were published in Special Publication No. 787¹¹.

5. **Classification by Technological Intensity.**

In 1997, the OECD presented a technology classification for the Manufacturing Industries, divided into four main groups: High Technology Industries, Medium-high Technology Industries, Medium-low Technology Industry, and Low Technology Industry.

The classification is based on industry rank evaluation of two technology intensity indicators: (1) R&D expenditures divided by value added; (2) R&D expenditures divided by production. High score Branches in the 1st indicator show higher use of both, advanced equipment and advanced technology. There is also high link between production and usage of advanced technology.

⁶.United Nations, *Standard International Trade Classification, Revision III*, Statistical Papers, Series M, No. 34, New York 1986.

⁷ <http://unstats.un.org/unsd/cr/registry/regcst.asp?Cl=14>

⁸. Central Bureau of Statistics, *The Standard Classification of All Economic Activities 1993*, Technical Publication No.63, Jerusalem 1993.

⁹.Central Bureau of Statistics, *The Standard Classification of All Economic Activities 1993*, Technical Publication No. 63, Second Edition, Jerusalem 2003.

¹⁰ Central Bureau of Statistics, *Import Destination Survey 1988*, Special Series No. 952.

¹¹ Central Bureau of Statistics, *Import Destination Survey 1982/83*, Special Series No. 787.

Israel adopted the OECD¹² classification with two exceptions:

- Branch "Equipment for control & supervision" is included in "High-technology Industries". In the OECD it is included in "Medium-high-technology Industries".
- Branch "Petroleum & its products" is included in "Chemicals & refining petroleum" in "Medium-high-technology Industries". In the OECD it is included in "Medium-low-technology Industries".

List of Manufacturing Industries included in each of the four main groups of the Classification by Technological Intensity:

- **High technology Industries** include electronic industries, equipment for control & supervision, office & computing equipment, aircrafts and pharmaceutical products.
- **Medium-high technology industries** include refining petroleum industries, chemicals (excluding pharmaceutical products), machinery, electronic equipment & electrical motors, motor vehicles and transport equipment (excluding aircraft industry).
- **Medium-low technology industries** include mining & quarrying industries, rubber & plastic products, iron & steel foundries, metal product, non-metallic mineral product and jewellery, goldsmith & silversmith.
- **Low technology industries** include food products, beverages & tobacco, textile, wearing apparel & leather, paper, printing & paper products, and wood & furniture.

6. Fuels

Data on import of fuels include crude oil and petroleum products such as residual fuel oil, gasoline and coal and its by-products.

The Value of Commodities

1. **The value of imports** is determined by the importers' report to Customs being based on the value of the transaction as defined in the Treaty of Brussels on the Evaluation of Goods for Customs Purposes (1950). The value of the transaction represents the value for which the goods were sold supplemented by expenditure on transportation and insurance as far as the border of the importing country, including costs of unloading at the exporting port. This definition of the value of the transaction in imports corresponds to the value of the goods according to C.I.F. (Cost, Insurance, Freight).

In most of the cases, the value for Customs purposes includes an imputation of local costs - wharfage and portage fees.

Import taxes and other taxes levied on imported goods are not included in the value for Customs purposes.

In the event of import of products unaccompanied by monetary recompense, where difficulty exists in determining the value of the transaction (as in the case of gifts), the value is determined by an estimate based on market price. So, for example, the cost of import of gifts for museums is based on the valuation of an insurance assessor.

If imported commodities are freed against a deposit, the import is recorded according to the date of release against the deposit until the final settlement of the account. The amendment of this import is recorded with final settlement, which is also dated according to the actual release of the goods (in other words an amendment of the value of the import will take place after several months).

2. **Import** data are recorded in the import entry forms in the currency of the transaction and are calculated in Israeli Shekels, according to the exchange rate on the date they are freed by customs and are converted into U.S. dollars too. The exchange rates for these purposes are the exchange rates for customs purposes on the date of the presentation of the entry forms. In the publications on Foreign Trade, the values of imports and exports are presented in U.S. dollars.

¹² *Classification of Manufacturing Industries Based on Technology*, OECD Science, Technology and Industry Scoreboard, Towards a Knowledge-base Economy, Science and Innovation, OECD 2001, Annex I, pp.137-140.

Since the floating of the Israeli Pound in October 1977, the rates of exchange between major foreign currencies and the Pound or the Shekel are determined for customs according to the rate dictated by the customs authorities on the basis of data provided by the Bank of Israel. To the extent that exchange rates fluctuate more than 2 percent in the daily rate of any currency, as fixed by the Bank of Israel, so the rates for customs purposes may be changed even in the middle of the week

December 1980 and October 1985 changes were introduced concerning Israeli currency: December 1980 the prevailing currency, the Lira, was changed to shekel. The exchange rate was 10 Lira was equivalent to 1 Shekel. October 1985 the Shekel was changed into New Shekel. The exchange rate was 1,000 Shekels were equivalent to 1 New Shekel.

3. **The Value of exports** data are recorded according to F.O.B. (free on board) transaction values before discounts and commissions are paid to foreign factors.
4. **Export** data are recorded in the export entry forms in Israeli Shekels and in the currency in which the transaction is made. The conversion into U.S. dollars is carried out in the monthly summaries, according to the rate on the day the transaction was registered at customs.

Data Sources

1. The main sources for imports and exports data are the forms submitted to the customs authorities by importers and exporters (import and export entry forms).
2. In certain cases the sources are administrative summaries prepared by institutions, which supervise the foreign trade of groups of products, such as aircraft and ships.

An important portion of the fresh agriculture exports is carried out by the consignment method.

Diamond imports are recorded until 31 December 1982 according to administrative summaries and since 1 January 1983 - according to the system of all imports. The change in the recording system was applied on 1 October 1982.

Imports and exports of ships and aircraft are recorded according to data obtained from the Ministry of Transport and airlines and shipping companies.

Seasonally Adjusted Data

Several data series are presented Seasonally Adjusted.¹³

Beginning January 2005 the data analysis is done by means of the improved computer program X12-ARIMA/2000, replacing X12-ARIMA/2000 used before. This analysis is based on moving averages which calculates the seasonal factors-S for each month. These factors may change by use of supplemented or updated data.

Seasonally adjusted data include prior adjustment factors for trading days and festivals dates (P) that were calculated simultaneously by a new method, which was developed by the Central Bureau of Statistics.

Seasonal adjustments cannot be deducted from all the series and therefore some of the intermediate sums also include series for which no seasonal adjustments were found. New classification of trade data by branch of origin enables expansion of seasonally adjusted data series. Starting 'Foreign Trade Quarterly' No. 1, 1995, 8 new export series and 5 additional import series are published. Monthly data for 1988 and onward can be obtained from the Bureau's database for each basic series and for series totals.

¹³ Central Bureau of Statistics, 'Seasonal and Prior Adjustment Factors for 2008, Trends for 2004-2008' (Internet only, at the Central Bureau of Statistics site: Classification and Methods, Statistical Methods, Time Series).

(1) Net equals gross total less goods returned to the suppliers.

(2) No seasonal effect was found in these series.

(3) Percent change on previous period.

(1) הנתון שווה לברוטו בניכוי החזרות טובין לספקים.

(2) בסדרות אלה לא נמצאה השפעה עונתית.

(3) השינוי באחוזים, כל תקופה לעומת קודמתה.
